Swiss Waterproof Expansion Joint Systems
Our High-Quality Expansion Joint Systems in Use around the World

Soba Inter AG provides solutions for high-quality construction products that ensure optimum solutions to physical challenges when it comes to the sealing of buildings. Since 1976, it has been constantly developing new products and optimizing existing ones, and it has been awarded numerous patents. For decades, the established expansion joint strips have been the flagship product, especially RedLINE® and FlamLINE®. Soba Inter AG produces various certified products at its own plants in Switzerland, thus guaranteeing consistently high quality.

In addition to the reference projects on this page, Soba Inter products are used in a wide range of other ambitious buildings all over the world and deliver real customer satisfaction.

Soba Inter AG is a Schoop Group company based in Baden, Switzerland.
Efficient System Solutions for Three-Dimensional Joint Movements since 1976

Building components are permanently exposed to strong strains such as temperature fluctuations, earthquakes, and other physical conditions. These affect the volume and the composition of the materials used and the substance of the buildings, and can cause symptoms of fatigue or breakages with catastrophic consequences. Soba Inter AG provides high-quality solutions to ensure sustainable building quality.

Composite Parts without Weak Points Thanks to Vulcanization Method

The expansion zones in the center of the product (black or red area) are highly elastic to prevent sealing coatings on buildings from tearing. The established production method using vulcanization guarantees a consistent joint and a contiguous seal.

Benefits of RedLINE® and FlamLINE®

- Economic to fit thanks to prefabricated, precision-fit expansion joint strips
- Strips and preforms are supplied as fully fabricated systems
- No complex substructure thanks to sandwich construction
- No shielding necessary thanks to the quality of joint with seal
- Very high resistance to building vibrations (e.g., in the event of an earthquake)
- Smooth fitting without loops or bulges
- Easily follows the line of any joint
- Highly elastic expansion zone
- Force-fit connections on bitumen and with epoxy resin adhesives on concrete and metal, etc.
- Special metal connection pieces for connections to metal work
- Individual strips can be put together on site using the specially designed vulcanization device

Product Variety with Swiss Quality

An expansion joint strip is only as good as the elastic material it contains. Special elastic rubber compounds have been developed for the Soba Inter products, which make the products unique and guarantee a long service life for the expansion joint strips. Soba Inter AG complies with quality standards in accordance with ISO 9001 and 14001. You can recognize every Soba Inter product by its trademark.

Family Tradition of Innovation for Three Generations

Soba Inter AG is a subsidiary of Schoop + Co. AG. This traditional family-run Swiss company was founded back in 1955 and is now run by the third generation of the Schoop family.

The combined disciplines within the company and the broad range of experience obtained as a result form the ideal foundations for various patented products.

Since 1976, the Schoop family has brought out a range of innovations under the Soba Inter AG brand name. One of the problem solutions was the expansion joint strips, for which a patent was applied for 35 years ago. These have been used all over the world ever since.
FlamLINE® is the latest-generation expansion joint strip for bridging expansion joints in bituminous seals between building components. The high-resistance quality strip made of quality rubber offers highly efficient and safe fitting.

Optimized for All Applications
The FlamLINE® expansion joint strip seals all joint areas occurring along building transitions. The expansion joint strip is either delivered prefabricated with all preforms based on local building component dimensions or made to measure on the building site.

The support-free expansion zone to absorb the movement of building parts forms the center of the expansion joint strip. This is positioned along the joint. Depending on the strip type, movements of up to 240 mm are possible.

Adhesive Flanges
The two adhesive flanges on the sides are reinforced with a holder. A flame is used to seal this adhesive flange to the bituminous seal or it is glued directly to the substrate (e.g., concrete or steel) with epoxy resin adhesive to form a force-fit connection.

Elastic Expansion Zone
FlamLINE® is the latest-generation expansion joint strip for bridging expansion joints in bituminous seals between building components. The high-resistance quality strip made of quality rubber offers highly efficient and safe fitting.

Material Properties
The elastic material for FlamLINE® consists of a butyl elastomer with a range of properties:

- Outstanding resistance to ozone corrosion
- Very good long-term heat resistance (up to +90 °C)
- Very good flexibility at low temperatures (down to –40 °C)

General resistance to chemicals:
- Very good against alkali, diluted acids, and saline solutions
- Excellent against water vapor
- Very good resistance to polar solvents such as alcohol and ketone

Resistance to nonpolar plasticizers and solvents (e.g., mineral oils, petrol, fuels, and aromatic compounds such as toluene) is low. Continuous contact with these substances is to be avoided.

Short-term contact with naked flames or mastic asphalt during the installation phase is possible without compromising the material’s properties.

We offer specialist products for further areas and applications (see page 15).

**Simple Fitting through Torching**

FlamLINE® expansion joint strips are efficient and safe to fit. The adhesive flanges on the side are torched to the bituminous surface seal in a sandwich construction by means of a direct flame or are fixed with epoxy resin adhesive directly onto a concrete or wall substrate to form a force-fit connection.

FlamLINE® expansion joint strips are generally delivered prefabricated with all preforms on a project-specific basis. For installations in several stages or for very long building joints that make handling more difficult, the specially developed vulcanization device can be used to produce the strip on site. Ask our technical services department directly about the options available.

**Wide Range for Varied Applications for Bridging Joints**

Building parts vibrate in all directions, depending on the substrate composition, external influences from adjacent infrastructures, or earth movement. The FlamLINE® product range provides an optimum flexible joint connection for a very wide range of longitudinal (A), lateral (B), and vertical (C) movements.

- **FlamLINE® 20**
  - A Long: building movement max. ± 20 mm
  - B Lateral: building movement max. ± 10 mm
  - C Vertical: building movement max. ± 15 mm

- **FlamLINE® 40**
  - A Long: building movement max. ± 40 mm
  - B Lateral: building movement max. ± 20 mm
  - C Vertical: building movement max. ± 30 mm

- **FlamLINE® 100**
  - A Long: building movement max. ± 100 mm
  - B Lateral: building movement max. ± 50 mm
  - C Vertical: building movement max. ± 75 mm

- **FlamLINE® 240 G**
  - A Long: building movement max. ± 240 mm
  - B Lateral: building movement max. ± 120 mm
  - C Vertical: building movement max. ± 180 mm

25.4 mm = 1 inch

Simple and practical corner formats for efficient fitting to the building.

Optimum adjustment of FlamLINE® to building structures to secure the seal of the building.

Consistent FlamLINE® joint seal over a number of corners and levels.

Special plate transition and interim pieces for connection to metal work.

Enclosures can easily be vulcanized into the FlamLINE® expansion joint strip.

Optimum seals, even underground for tunnels and other projects.
RedLINE® is the classic expansion joint strip made of quality rubber for bridging expansion joints in bituminous seals between building components. The conventional laying method using liquid hot bitumen means this expansion joint system can provide quick and safe installation of outstanding quality.

Optimized for All Applications

The RedLINE® expansion joint strip seals all joint areas occurring along building transitions. The expansion joint strip is either delivered prefabricated with all pre-forms based on local building component dimensions or made to measure on the building site.

Adhesive Flanges

The two adhesive flanges on the sides are clad with a special fleece. These adhesive flanges are bonded with hot bitumen directly to the bituminous waterproofing membrane, the flanges top and bottom are sealed on both RedLINE® sides between the waterproofing layers. Depending on the installation, they can also be bonded directly to the substrate with epoxy resin adhesive or liquid plastic to form a force-fit connection.

Elastic Expansion Zone

The expansion zone without the fleecel cladding, to absorb the movement of building parts, forms the center of the expansion joint strip. This is positioned along the joint. Depending on the strip type, movements of up to 240 mm are possible.

Material Properties

The elastic material for RedLINE® consists of an EPDM elastomer with a range of properties:

- Outstanding resistance to ozone corrosion
- Very good long-term heat resistance (up to +90 °C)
- Very good flexibility at low temperatures (down to –40 °C)

General resistance to chemicals:

- Very good against alkali, diluted acids, and saline solutions
- Good against water vapor
- Good resistance to polar solvents such as alcohol and ketone

Resistance to nonpolar plasticizers and solvents (e.g., mineral oils, petrol, fuels, and aromatic compounds such as toluene) is low. Continuous contact with these substances is to be avoided.

Short-term contact with hot bitumen or mastic asphalt during the installation phase is possible without compromising the material's properties.

We offer specialist products for further areas and applications (see page 15).

Simple Fitting through Pouring

RedLINE® expansion joint strips are simple and safe to fit. They are fixed with liquid hot bitumen poured between the bituminous surface seal or joined directly to the concrete or wall substrate with epoxy resin adhesive or liquid plastic to form a permanent force-fit connection.

RedLINE® expansion joint strips are generally delivered prefabricated with all preforms on a project-specific basis. For installations in several stages or for very long building joints that make handling more difficult, the specially developed vulcanization device can be used to produce the strip on site. Ask our technical services department directly about the options available.

Wide Range for Varied Applications for Bridging Joints

Building parts vibrate in all directions, depending on the substrate composition, external influences from adjacent infrastructures, or earth movement. The RedLINE® product range provides an optimum flexible joint connection for a very wide range of longitudinal (A), lateral (B), and vertical (C) movements.

- **Soba® RedLINE® 20**
  - A Long: building movement max. ± 20 mm
  - B Lateral: building movement max. ± 10 mm
  - C Vertical: building movement max. ± 15 mm

- **Soba® RedLINE® 40**
  - A Long: building movement max. ± 40 mm
  - B Lateral: building movement max. ± 20 mm
  - C Vertical: building movement max. ± 30 mm

- **Soba® RedLINE® 100 G**
  - A Long: building movement max. ± 100 mm
  - B Lateral: building movement max. ± 50 mm
  - C Vertical: building movement max. ± 75 mm

- **Soba® RedLINE® 240 G**
  - A Long: building movement max. ± 240 mm
  - B Lateral: building movement max. ± 120 mm
  - C Vertical: building movement max. ± 180 mm

25.4 mm = 1 inch

Prefabricated strips with all preforms for user-friendly fitting.

Combination of various strip types (e.g., transitions RL 100–40).

Enclosures can be vulcanized into the strip.

With vulcanized miter joints, the strips can be easily adapted to any changes of direction.

Safe sealing of building transitions between old and new buildings.

RedLINE® is applied directly to concrete with epoxy resin adhesive to form a force-fit connection.
Other Quality Expansion Joint Strips for Various Applications

EpoLINE®
EpoLINE® is a rubber expansion joint strip. It is used for bridging three-dimensional joint movements between dilating building parts. Prefabricated based on the local component dimensions, the strip system allows quick and safe fitting of joint seals.

Technology
EpoLINE® consists of an elastic section and two adhesive flanges on the sides. These are applied with epoxy resin adhesive to form a permanent seal. This concept separates the functions of "movement absorption or expansion" and "incorporation into the epoxy resin adhesive."

MasterLINE®
MasterLINE® is made of synthetic rubber, which enables metal-free connection and conclusion of bituminous surface seals. The strip system can be used anywhere where a strong, run-free sealed connection is required, for example on balustrades, walls, windows, etc. (ideally with short connection heights).

Technology
MasterLINE® is applied to the final component (e.g., concrete, metal, or wood) with epoxy resin adhesive to form a force-fit connection. It is connected to the bituminous surface seal by torching. No shielding is required thanks to the good connection between the bitumen strip and the connecting strip. The standard range incorporates strips in various widths as well as preforms, such as internal and external corner pieces and enclosures of various shapes.

Epoxy resin adhesive
MasterLINE®
Epoxy resin adhesive
Mechanical protection
Direct gluing of the expansion joint strip to the concrete surfaces.

CombiLINE®
CombiLINE® is made of synthetic rubber to allow the sealing of non-dilating working joints. It can easily be joined to a wide range of materials (e.g., concrete, wood, or metal). Prefabrication is not required as all connections can be made on site.

Technology
CombiLINE® is always fitted with epoxy resin adhesive because of its 1 mm thickness. The adhesive surface must be at least 4 cm to guarantee optimum adhesion to the substrate. The strip must not be exposed to the weather and must therefore be covered with a building protection mat or simlar, or covered completely with epoxy resin adhesive and sprinkled with quartz sand. The standard range incorporates strips in various widths as well as preforms, such as internal and external corner pieces.

Bespoke Expansion Joint Strips
Soba Inter AG is a world-leading company when it comes to waterproofing in building construction and specifically the bridging of joint movements. The comprehensive product range provides the whole world with high-quality solutions for various applications.

Ongoing research and development of new materials and processing methods to meet global customer requirements is one of the core principles of Soba Inter AG. We put intensive research into the long-term durability of our products, their compatibility with drinking water and food, and their behavior in contact with oils.

Please feel free to contact us if you have an individual requirement or a special request that is not covered by our existing expansion joint strips, or if you wish to have a product made in your corporate colors.

We can produce a bespoke solution based on our many years of experience.
